

pr	int(Hello World!)
	The string must be enclosed in double quotes. Correct
	The print function must be used within a function.
	The print function must be indented.
0	The print function must be called with square brackets.
	tion 6 of 24 n creating a match-case block, which line defines the default case?
	case "default":
	default:
0	case _:
	Correct The default case uses an underscore.
	case:
Wha	tion 7 of 24 t will this print, assuming runtest() is a function that does not return a value? int(runtest())
Wha	t will this print, assuming runtest() is a function that does not return a value? int(runtest()) the code inside the function
what production of the control of th	t will this print, assuming runtest() is a function that does not return a value? int(runtest()) the code inside the function the address of the function object the value None Correct
What prr	t will this print, assuming "runtest() is a function that does not return a value? int(runtest()) the code inside the function the address of the function object the value None Correct Since this function returns nothing, "None" will be printed.
What prr	t will this print, assuming runtest() is a function that does not return a value? int(runtest()) the code inside the function the address of the function object the value None Correct
What pr Ques	t will this print, assuming "runtest() is a function that does not return a value? int(runtest()) the code inside the function the address of the function object the value None Correct Since this function returns nothing, "None" will be printed.
What prr Quess What	t will this print, assuming runtest() is a function that does not return a value? int(runtest()) the code inside the function the address of the function object the value None Correct Since this function returns nothing, "None" will be printed. This will error out.
What prr Quess What	t will this print, assuming runtest() is a function that does not return a value? int(runtest()) the code inside the function the address of the function object the value None Correct Since this function returns nothing, "None" will be printed. This will error out. tion 8 of 24 t will the following code print? f inc(a,b=1): return(a+b) a=inc(1) a=inc(a,a) print(a)
What prr Quest What de	t will this print, assuming runtest() is a function that does not return a value? int(runtest()) the code inside the function the address of the function object the value None Correct Since this function returns nothing, "None" will be printed. This will error out. tion 8 of 24 t will the following code print? f inc(a,b=1): return(a+b) a=inc(1) a=inc(a,a) print(a)

	values[3]
	Correct
	values(4)
0	values[4]
Ques	tion 10 of 24
	t is a Python library module?
	a Python function without parameters
	pre-built code you can use in your program Correct
	the code that initializes your variables
	tion 11 of 24 t will be the result of the following code?
pr	estr = "This is a string" int(thestr) estr = 5
	The code will print "This is a string" and set the value of thestr to 5. Correct
	The code will cause an error.
	The code will print the value 5.
	The code will print "This is a string".
	tion 12 of 24 th alternative code is logically equivalent to the code below?
Whic	
ma	th alternative code is logically equivalent to the code below? xnum = x if (x>y) else y maxnum = y if (x>y): maxnum = x
Which ma	th alternative code is logically equivalent to the code below? xnum = x if (x>y) else y maxnum = y if (x>y):
ma	th alternative code is logically equivalent to the code below? xnum = x if (x>y) else y maxnum = y if (x>y): maxnum = x
Which ma	th alternative code is logically equivalent to the code below? xnum = x if (x>y) else y maxnum = y if (x>y): maxnum = x Correct if (x>y): maxnum=y elif (x=y): maxnum=y else:
maa 🍑	th alternative code is logically equivalent to the code below? xnum = x if (x>y) else y maxnum = y if (x>y): maxnum = x Correct if (x>y): maxnum=y elif (x=y): maxnum=y else: maxnum=x if (x>=y): maxnum=x else: maxnum=x
whice maa	th alternative code is logically equivalent to the code below? xnum = x if (x>y) else y maxnum = y if (x>y): maxnum = x Correct if (x>y): maxnum=y elif (x=y): maxnum=y else: maxnum=x if (x>=y): maxnum=x elif: maxnum=y if (y>x): y else: x

whice ma	th alternative code is logically equivalent to the code below? xnum = x if (x>y) else y maxnum = y if (x>y): maxnum = x Correct if (x>y): maxnumey elif (x=y): maxnumey else: maxnumex if (x>=y): maxnumex elif: maxnumex elif: maxnumex elif: maxnumey if (y>x): y else: x

```
def func[arg1, *args]
      def func(arg1, *args)
    Correct
Question 14 of 24
Given this variable, how can you print it reversed?
  s="123456"
       print(s[-1::])
       print(s[:-6:-1])
       print(s[::-1])
     Correct
       print(s[1::-1])
Question 15 of 24
What will this code print?
      x=int("five")
  except ValueError:
  print("There is a value error.")
finally:
      print("Something went wrong.")
Something went wrong.
There is a value error. Something went wrong.
     Correct
There is a value error.
This code will exit with an error.
Question 16 of 24
What is the purpose of the super() function when working with Python classes?
to indicate to Python that the current class inherits from a specific parent class
to call the initializer function of the parent class of the class where super() is being called from
to ensure that the properties of the current class are initialized before those of the parent class
\bigcirc to access methods and properties within the parent class of the class where super() is being called from
Question 17 of 24
What is the correct way to define a class named "Point" that is initialized with x and y coordinate
values?
          def __init__(self):
              self.x = x
               self.y = y
       class Point():
          def __Point__(self, x, y):
              self.x = x
               self.y = y
```

```
class Point():
          def __initialize__(self, x, y):
    self.x = x
    self.y = y
\odot
      class Point():
    def __init__(self, x, y):
        self.x = x
        self.y = y
     Correct
Question 18 of 24
What is the output of the code below?
  thestr = "Ogres are often foolhardy oafs" newstr = "" \,
  for i, c in enumerate(thestr):
    break
newstr += c
  print(newstr)
Ogres are ften flh
     Correct
Ogres are ften f
gres are ften flhar
gres are ften flh
Question 19 of 24
What is the proper code for creating a "for" loop that will execute 9 times starting at the number
      for i in range(6, 16):
     Correct
for i in range(6, 9):
      for i in range(6, 6+9):
       for i in range(6, 15):
Question 20 of 24
What will this code print?
  var="123456789"
  print(var[1:6:2])
Correct
23456
       24
O 35
```

Ques: Wha	t will this line do?
va	lue=input("2+2=")
	It will place the sum of 2 and 2 into a variable.
	it will check if the user's answer is correct.
	It will print the sum of 2 and 2 to the screen.
	it will store the user's input into a variable. Correct
	tion 22 of 24
vvna	t is the purpose of the finally section of an exception handling statement?
0	The finally section is where control is transferred to in order to handle an exception that has occurred.
	The finally section is where control is transferred to after an exception occurs and is handled by the "except' section.
	The code in the finally section always runs, so it's a good place to clean up any allocated resources. Correct
0	The finally section runs only if none of the except sections are able to handle the error.
tr	assume two integer variables, x and y /: result = x / y
tr:	y:
Ø	<pre>/: result = x / y except ZeroDivisionError as e:</pre>
